Principles and Practice of Clinical Cardiovascular Genetics Jun 22 2019 Consisting of contributions from experts in all specialties of cardiovascular genetics and applied clinical cardiology, Principles and Practice of Clinical Cardiovascular Genetics serves as the comprehensive volume for any clinician or resident in cardiology and genetics. Each chapter provides a detailed and comprehensive account on the molecular genetics and clinical practice related to specific disorders or groups of disorders, including Marfan syndrome, thoracic and abdominal aortic aneurysms, hypertrophic, dilated and restrictive cardiomyopathies and Arrhythmogenic right ventricular cardiomyopathy, as well as many others.

All sections comprehensively address cardiovascular genetic disorders, beginning with an introduction and including separate sections on the disease's basic biological aspects, specific genetic mechanisms or issues, clinical aspects, genetic management (e.g., genetic diagnosis, risk assessment, genetic counseling, genetic testing), and clinical management issues. The final section exclusively addresses the management of cardiovascular genetic disorders, specifically considering stem cell therapy, genetic counseling, pharmacogenomics and the social and ethical issues surrounding disease treatment.

The Genetics of Aging Apr 24 2022 The Genetics of Aging is divided into several sections in an attempt to provide a logical progression from the level of the genome to the realm of human genetics. The relationship between the genetic material and aging will be thoroughly explored in the initial chapters. These chapters discuss in depth the various theories that have been proposed for the mechanisms of aging at the molecular level and present data which either support or contradict these hypotheses. Subsequent chapters will deal with the genetics of aging in organisms ranging from paramecium to mammals. The largest section of this volume will be devoted to several important areas in human genetics: human genetic disorders which feature premature aging, the effect of human parental aging on the production of genetically abnormal offspring, the genetics of human longevity, and a review of studies on aging human twins. Over the last few decades genetic technology has provided enormous insight into a number of disciplines. Therefore, in the last few chapters, several genetic approaches to the study of aging are discussed: somatic cell genetics, immunogenetics, and behavioral genetics. As the goal of this volume is to present a comprehensive examination of the genetics of aging, most chapters are oriented toward general review of their respective areas. It is my hope that this volume will encourage clinical, biological, and behavioral investigators to turn their attention to the genetic aspects of aging as well as to employ genetic technology to obtain further insight into aging processes.

HLA and Disease Associations Jun 26 2022 The human leukocyte antigen (HLA) or tissue types are the products of a rapidly developing field of knowledge within the last 20 years. In the early stages of the research many investigators suspected the existence of a complex series of transplantation antigens, but it was widely believed that these antigens would not be well-defined even in this century. Yet in the last two decades as many as 124 different HLA antigens determined by at least 7 very closely linked genes located on the short arm of chromosome 6 have been identified and subsequently agreed upon by an international nomenclature committee. 1 Extensive international collaboration fueled by the potential clinical application of these antigens to clinical transplantation has advanced the field rapidly. There were nine inter national histocompatibility workshops held during this period. Although identification of HLA antigens was of primary clinical importance in transplantation 2 and of great basic interest in human genetics and anthropology, a rather unexpected bonus has been the determination that HLA antigens are associated with disease susceptibility to a greater extent than any other known genetic marker in man. In the past, many genetic polymorphisms have been suspected to be associated with diseases. The most extensively studied markers are blood groups, enzymes, and serum proteins. A comprehensive account of published studies, totalling approximately 1,000, of these markers is available in a book by Mourant et al. **Genetic Skin Disorders** Sep 05 2020 This valuable text represents a comprehensive survey of well over 300 distinct inherited dermatologic conditions. Each disease entry follows a consistent format, allowing the clinician to quickly scan and access key information for differential diagnosis. Clinical descriptions, along with discussions of therapy and counseling, are provided. This book will be an invaluable resource for

physicians, dentists, and other health professionals and for basic scientists interested in developmental processes and genetic perturbations that affect them.

Genetic Effects on Aging Jan 22 2022 This volume provides background knowledge useful to those setting out to do genetic studies of aging in mammals, and raises vital questions: How many genes are important in mammalian aging? What are the optimal methods for their study? To what degree are patterns of aging, and patterns of growth and development part of the same process? Do patterns of development predict subsequent patterns of growth and aging? Are there a few fundamental aging processes, or does every biological system age? The rapid rate of progress in this field required a new volume with a new approach, based on the combination of classical genetics and the powerful new tools of molecular genetics. Although mammalian systems are emphasized, representatives of the advanced genetic studies in *Drosophila* and other model systems are included. The purpose is to enrich and stimulate genetic studies of mammalian aging by suggesting and evaluating future possibilities.

Mendelian Inheritance in Man Aug 17 2021 The twelfth edition of this classic reference work includes: • More than 2,000 new entries • A total of more than 9,000 entries • New features and enhancement of the familiar old features • Mapping information on more than 4,000 genes of known function • Information on specific point mutations responsible for more than 700 genetic disorders or neoplasms Mendelian Inheritance in Man (MIM) is a genetic knowledgebase that serves clinical medicine and biomedical research, including the Human Genome Project. It aims to be comprehensive (not only complete, but also collated, integrated, and interpreted), authoritative (not only accurate but also sound in its interpretations and judgements), and timely (not only up-to-date but also historically dimensioned). From a review of the eleventh edition, Reproductive Toxicology: "Even the convenience of computer-based forms of MIM cannot eliminate the need for MIM in book form. The preface provides a wonderful synopsis of human genetics. The information contained in this text serves as a concise review for those with a genetics background." From a review of the tenth edition, New England Journal of Medicine: "[Victor McKusick] has been for all these years the shepherd of the development of the field [of clinical genetics]. Perhaps his most important pragmatic achievement has been the 10 editions of Mendelian Inheritance in Man, which rapidly became and has remained the principal source of information on inherited diseases for all clinical geneticists. "In addition to the erudite entries in the books, the references given with each description represent a magnificent bibliography of clinical genetics. With McKusick's leadership and continued interest in gene mapping, the book also represents an important compendium of the location of genes on specific chromosomes. "The book is a magnificent security blanket for the clinical geneticist and should be in the libraries not only of these specialists, but also of all others who see patients with diseases that have genetic components."

Neurocutaneous Diseases Nov 07 2020 Neurocutaneous Diseases is a systematic presentation limited to diseases that affect both of the nervous

system and skin of humans. Neurologists and dermatologist will find knowledge of these diseases of real clinical value. Many of the diseases described in these pages do not affect the skin and nervous system simultaneously. Many of these diseases, mostly not well understood, may stimulate new lines of scientific inquiry, for understanding of a pathologic change in easily accessible dermal cells that promises to clarify a more recondite brain disease. This book is organized into five main parts. The chapters describe different types of diseases including those with autosomal dominant inheritance, those with autosomal recessive inheritance, those with x-linked inheritance, those with unknown or multiple inheritance and congenital and vascular anomalies. These diseases include neurofibromatosis, Cockayne's Syndrome, adrenoleukodystrophy, albinism and neurocutaneous melanosis. This book will be of interest to dermatologists and neurologists.
